What is INRiM

INRiM is a public research centre and is Italy’s national metrology institute (NMI). INRiM realises, maintains, and develops the national reference standards of the measurement units of the International System (SI), consisting of seven base units - metre, kilogram, second, ampere, kelvin, mole, and candela - and derived units. Thanks to these standards, the Institute ensures measurements that are reliable and comparable on both a national and international scale.

Vision

The global challenges that INRiM is watching out for are the fight of pollution, the technological escalation, the scientific competition in the metrological fields, such as: the aero-space, the fundamental research, the public health, the food and the environment.

Divisions

The task of the technical-scientific structures of the INRiM is to plan and manage the technical-scientific activities of the Institute. The structures are:

- Advanced materials metrology and life sciences
- Applied metrology and engineering
- Quantum metrology and nano technologies

Each division contributes within its competence to the three Institute missions: Developing and fostering scientific research in metrology, Acting in the capacity of Italian National Metrology Institute, Fostering, releasing and transferring the available knowledge to the economy and to society at large.

Training and work opportunities

INRiM offers the opportunity for young minds to challenge themselves with new innovative challenges of our millennium related to Metrology. Experts, students and graduates can enjoy INRiM programs for their personal and professional advancement.

Collaborations

National and International Associations and Research Institutions, Universities, Schools, Companies.
